Source: canonical contract v1.0.0 (fcf_m2 V3 run 2026-07-19) · Vintage: inputs 2026-06-24; eGRID2023r2; verified 2026-07-19 · Scenario: 2026 baseline, seeded discrete-event simulation (400 days) · Model: fcf_m2 v3.0.0 / contract v1.0.0 · Assumption: demand synthetic/uncalibrated — screening only

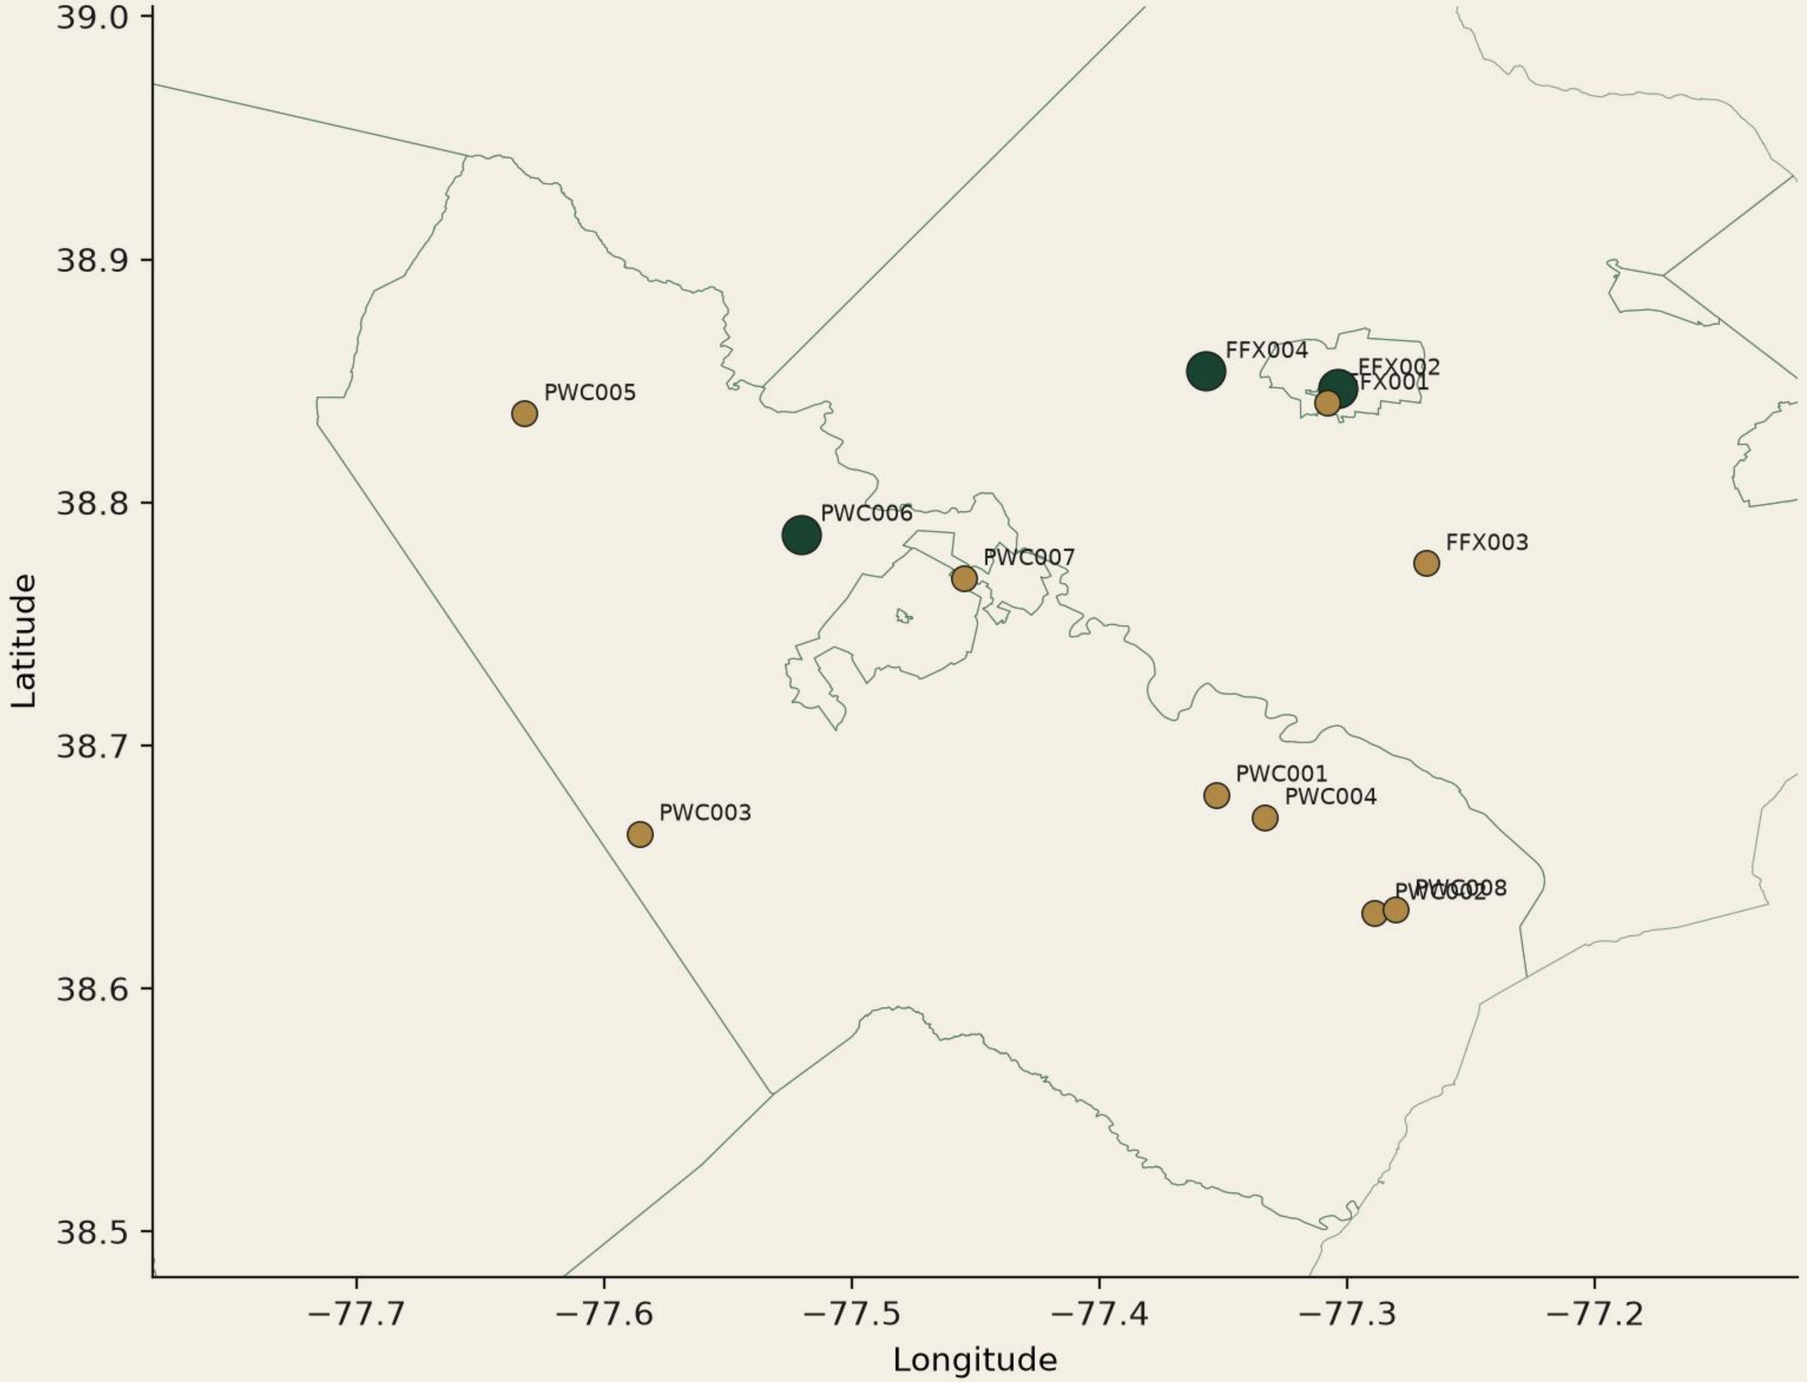

What this analysis is NOT

- 0 of 12 sites have High data confidence — every electrical value awaits confirmation
- Capacity is a PLACEHOLDER at 12/12 sites (no utility/facility verification yet)
- Demand model is synthetic and uncalibrated; growth multipliers are provisional
- Costs are screening-class benchmarks — not budgets, quotes, or engineering estimates
- No site is approved: electrical, ADA, fire, stormwater, and AHJ gates all remain
- Client Meeting #2 follow-up is prepared but not yet held — nothing implies endorsement
- No MATLAB simulation results are claimed (no licensed execution available)

Why we show this slide

Honest uncertainty is the evidence discipline that makes the staged, trigger-gated strategy credible: verify first, energize when data says so.

Candidate Site Readiness Map
